# Product Environmental Aspects **Declaration**

EP and IJ printer (PCR number: AD-04)

No. AD-17-E965 Date of publication Dec./28/2017

1.95kg

294kg 339kg

# http://www.brother.co.jp/

For inquiry: **Environmental Product Group** Production Innovation Dept. **Production & Engineering Center** 

Brother Industries, Ltd. Tel: +81-52-824-2511 (Representative)

# Black & White Laser Printer HL-L2390DW Specifications:

- · Electrophotographic Printer (EP)
- Black & White
- Printing Speed: 30ppm (A4)
- · Maximum Printing Size: Legal
- Flexible Wireless Interfaces
- Duplex Printing

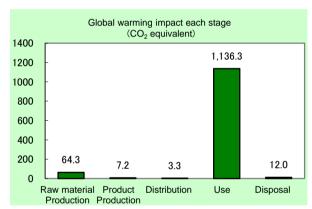

The following data is calculated by assuming the product prints 540,000 sheets in 5-year usage period.

< Main environmental impact in the product lifecycle > 20,400MJ

**Energy consumption** Global warming impact (CO<sub>2</sub> equivalent)

1,223.1kg Acidification impact (SO<sub>2</sub> equivalent) Mineral resources(Iron ore equivalent) Energy resources(crude oil equivalent)

- Electric power consumption in 5 years of "Use stage" is 318kWh.
- The above data does not include the environmental impact of the paper that is used for printing.

### Notes:

- 1. Original LCA data is available on PEIDS: Product Environmental Information Declaration Sheet, and Product Data Sheet.
- 2. Unified rules and requirements for EcoLeaf LCA, for intended product category, are available as a PCR:Product Category Rule. Visit EcoLeaf website under JEMAI homepage at http://www.ecoleaf-jemai.jp/eng/ for details.
- 3. Basic Units used for calculations are based on Japan domestic data at this time, due to a lack of base data to establish localized Basic Unit for overseas locations adequately.
- 4. This declaration was produced using Product Category Rule intended for a product model sold in the Japanese market and using the qualitative and quantitative data collected in Japan.

## [Supplemental environmental information]

The product assembly and main parts of toner and photoreceptor are produced at plants certified with ISO 14001. The product conforms to the International Energy Star Program.

PCR review was conducted by: PCR Deliberation Committee, January 01, 2008, Name of representative: Yohji Uchiyama, University of Tsukuba, Graduate School

Independent verification of the label and data, according to ISO 14025 🔲 internal 🔳 external Third party verifier \*: System auditor, Yasuo Koseki

Program operator: Japan Environmental Management Association for Industry Email: ecoleaf@jemai.or.jp

<sup>\*</sup> In the case of a business entity certified as an Ecoleaf-data-collection system, the names of certification auditors are written. The EcoLeaf is an environmental labeling program that belongs to the ISO-Type III category.

### [Notes for readers: Ecol eaf common rules]

### I. Stage related

- A "Production" stage is intended for two sub-stages listed below
- (1) "Raw material" production: consists of mining, transportation and raw material production.
- (2) "Product" production: consists of the parts processing, assembly and installation.

  B. "Distribution" stage is intended for transportation of produced product. Transportation of consumables and maintenance goods (e.g. replacement parts) for use of the product are included into "Use" stage.
- C. "Use" stage is intended for use of the product (active mode, standby mode, etc.) and production, transportation to disposal of consumables/maintenance goods (e.g. replacement parts)
- D. "Disposition" stage is intended for environmental impacts by product disposition.

- A. Data of mineral ore on "Exhaustible resources" are presented in weight of pure ingredients (e.g. iron, aluminum) in the ore.
- 3. Data on energy resources are presented based on origin in calorific value. e.g. Data on uranium ore presents weight of uranium concentrate, which is available for use as an atomic fuel.
- C. Data of discharge to water system are in actual figure (not calculated using unit function in inventory analyses).

### III Impact analyses

Result of the "Impact analyses" is found in converting results of inventory analyses into total amount of a reference material (e.g. CO2 in case of "Global Warming").

A. Impact "by resource consumption" represents magnitude of impacts to resource depletion.

B. Impact "by emission/discharge to environment" represents magnitude of impacts to Atmosphere, Water and Soil system.

- A. Exponential notation, after the decimal point to two, should be used.
- B. Indicate "0" instead exponential notation, if the result of calculation or estimation is considered as "zero" or negligible in comparison to related results.

  C. Indicate " " if calculation nor estimation can not be done, in order to differentiate to indicate "zero".
- D. Row total of the data is automatically calculated, excluding a row includes " " item. Row total of such is presented as a blank (no data).

  (BGD for material production are for production from mineral ore. Those data do not include reclaiming processes like recovery from scrap.)

- 1. Product weight includes the accessories as standard equipment, a toner cartridge and a drum unit. Packaging weight includes packaging material and appended goods (e.g., user's manual, other printed matter, polyethylene bags).
- 2. Production stage includes the production/distribution impact of the parts making up a machine and the initial set of a toner cartridge and a photo conductor, as well as the impact of product assembly,
- 3. Distribution stage's impact is calculated according to the PCR. The transportation distance of a product from an overseas factory to the port of Japan is based on actual distance.

The transportation distance in Japan uses 100 kmas average distance

4. Use stage's impact is calculated according to the PCR. It includes the impact of printing 540,000 sheets, calculated by supposing a user use a machine for 5 years.

It also includes the electricity consumption of a machine calculated based on 5-year use, supposing a month consists of 4 weeks, with weekly electricity consumption calculated by the TEC test procedure

The production, distribution, and disposal/recycle impact of the consumables used in those 5 years is also included.

The distribution impact of consumables is calculated under the same condition of products:

The transportation distance of consumables from an overseas factory to the port of Japan is based on actual distance. The transportation distance in Japan uses 100 km as average distance.

Since we have not collected consumables as a producer, which are newly introduced, they are assumed to be collected as general waste, crushed and separated as combustible/non-combustible material.

This stage includes the incineration impact of combustible materials and the landfill impact of non-combustible materials of consumables.

- 5. Disposal stage: Since we have not collected machines as a producer, they are assumed to be collected as general waste, crushed and separated as combustible/non-combustible material
- This stage includes the incineration impact of combustible materials and the landfill impact of non-combustible materials of machines.
- 6. Others: This declaration was produced using Product Category Rule intended for a product model sold in the Japanese market and using the qualitative and quantitative data collected in Japan.
